

**Climate change, glacier retreat and water resources availability in  
high mountain cities: case of Bolivia**

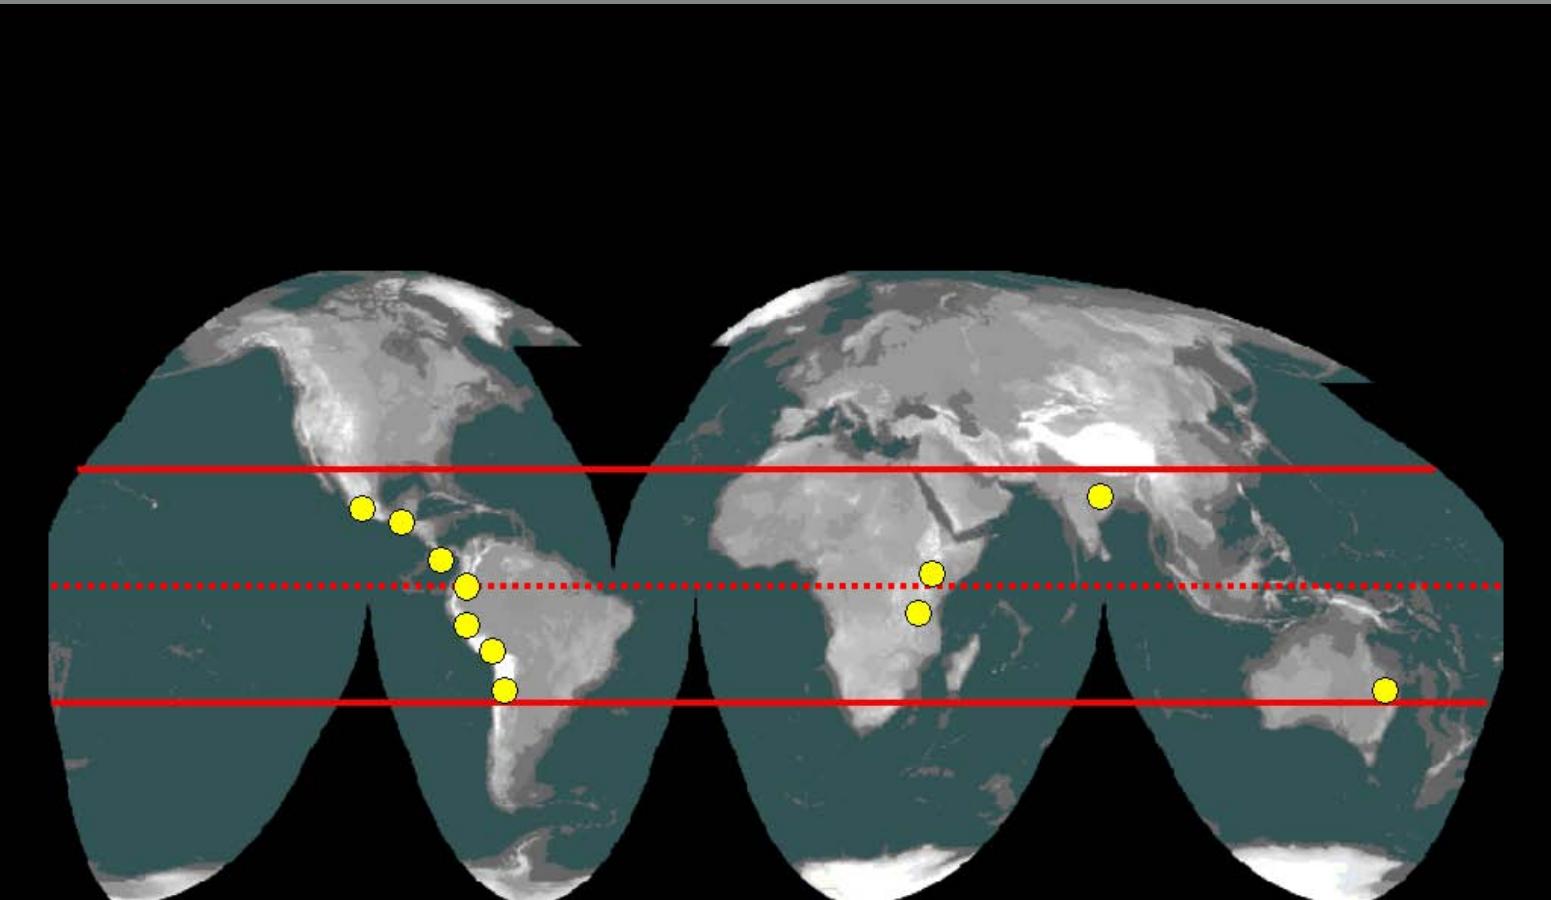

**Edson RAMIREZ Ph.D.**

# Glaciers and Altitude Water Resources Climate and Environmental Indicators

- ✓ The evolution of water resources
- ✓ The variability of the climate - hydrosphere - cryosphere in high altitude regions

# Tropical Glaciers distribution in the world

5% of the world's mountain glaciers

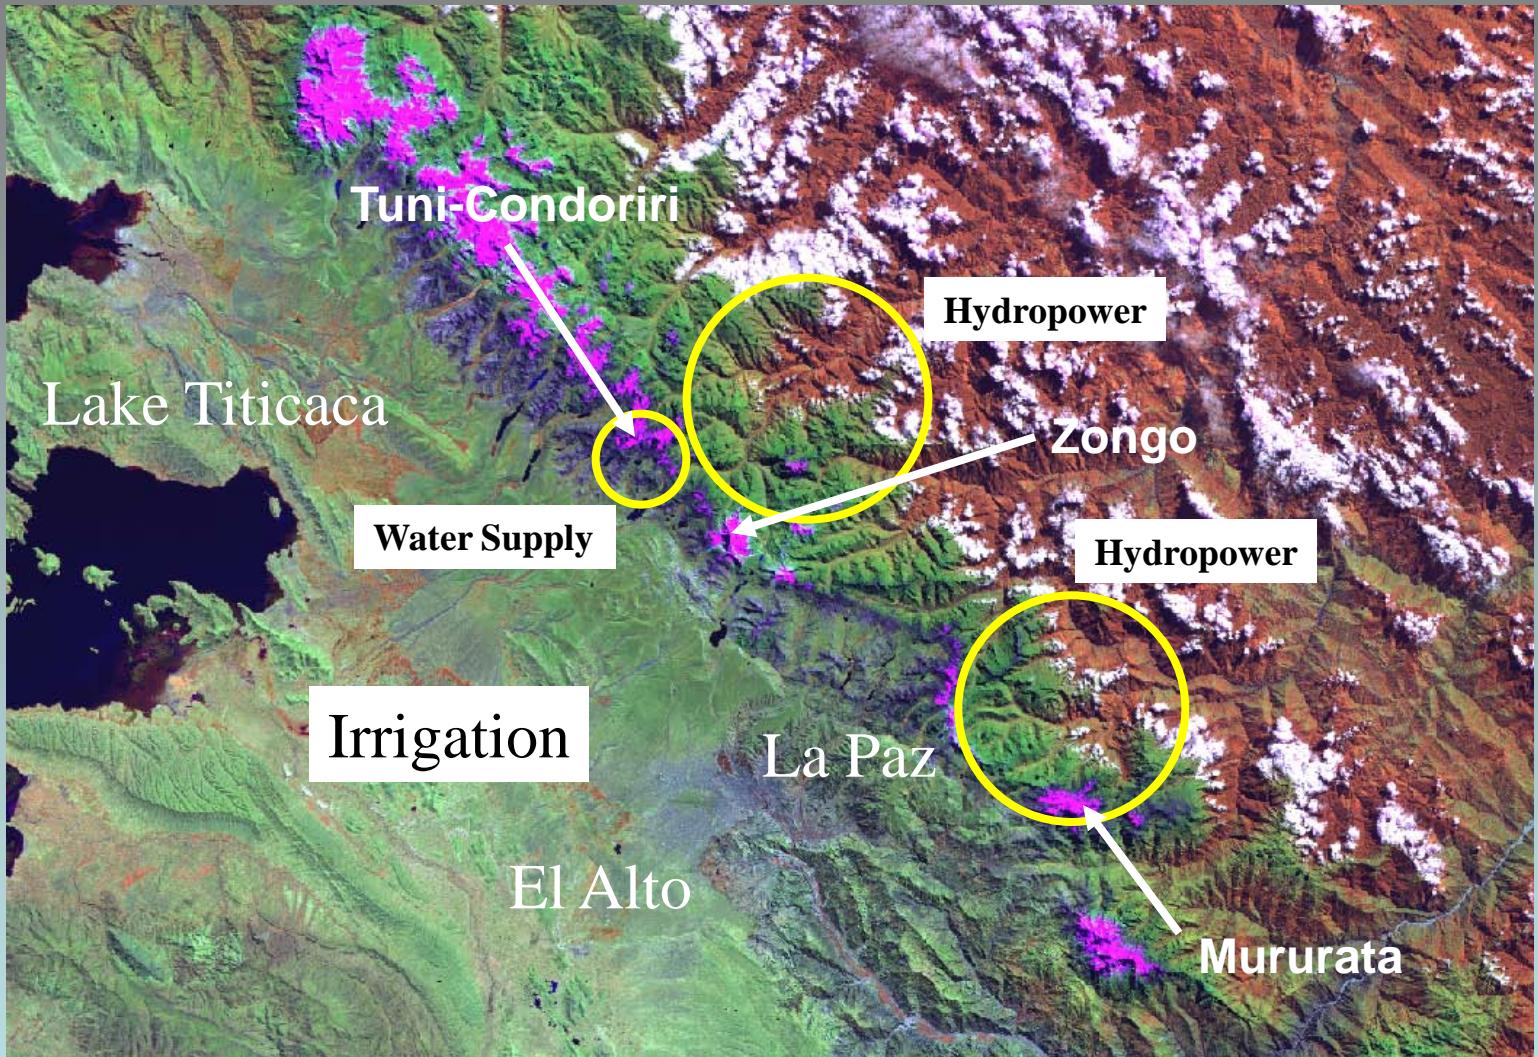

99% are concentrated in the Andes

70% in Perú, 20% in Bolivia, 10% in the rest

# Location of the “Cordillera Real” BOLIVIA

## Water glaciers uses

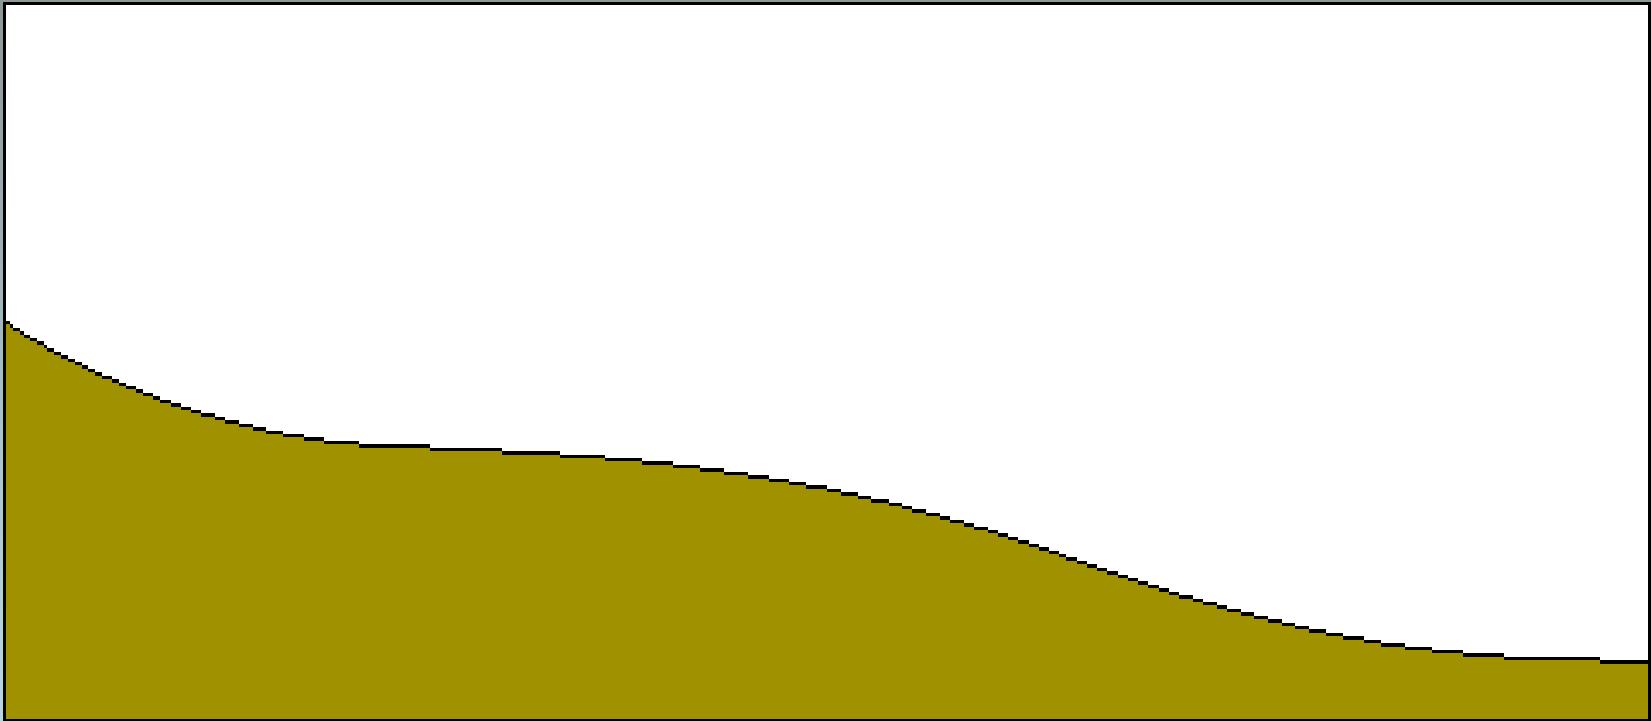

These glaciers were selected mainly because of the influence of ice melting on water resources for human consumption and hydropower generation for the city of La Paz and El Alto.

## Tropical glaciers respond to:

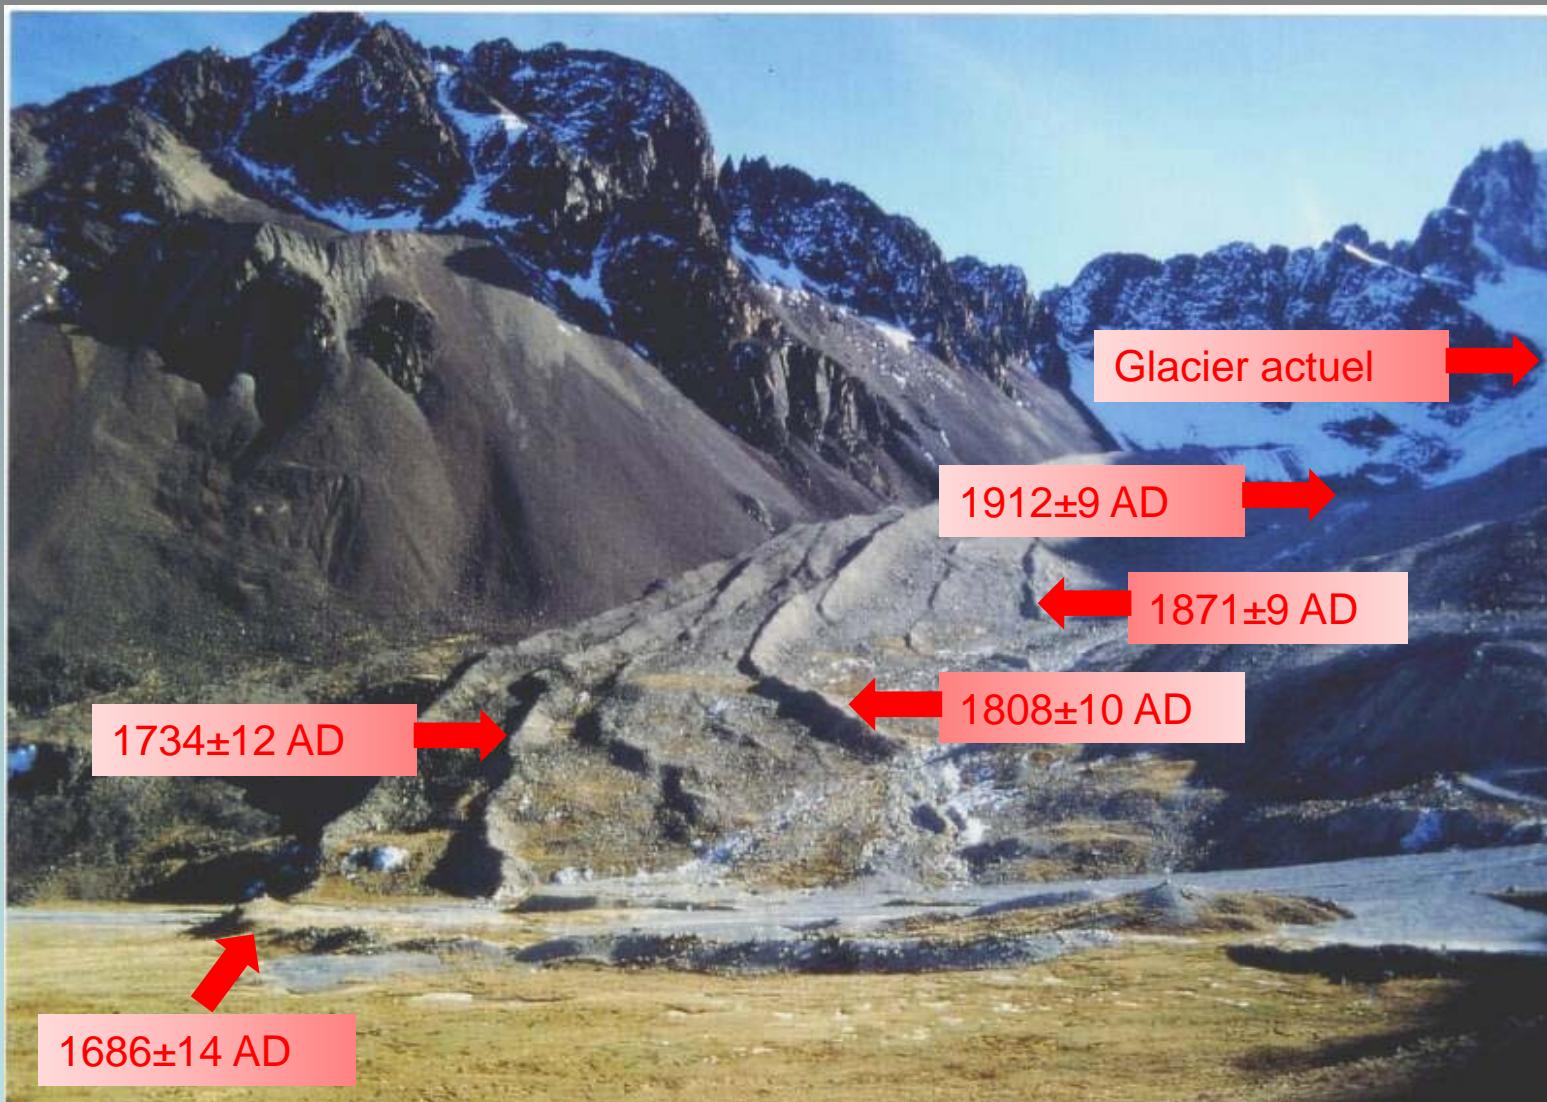

- Precipitation (Snow/Rainfall)
- Temperature
- Humidity
- Cloudiness
- Solar Radiation
- “El Niño” Climatic Events.

# Dynamics of a glacier

# Why the Bolivian glaciers are sensitive?

Precipitation

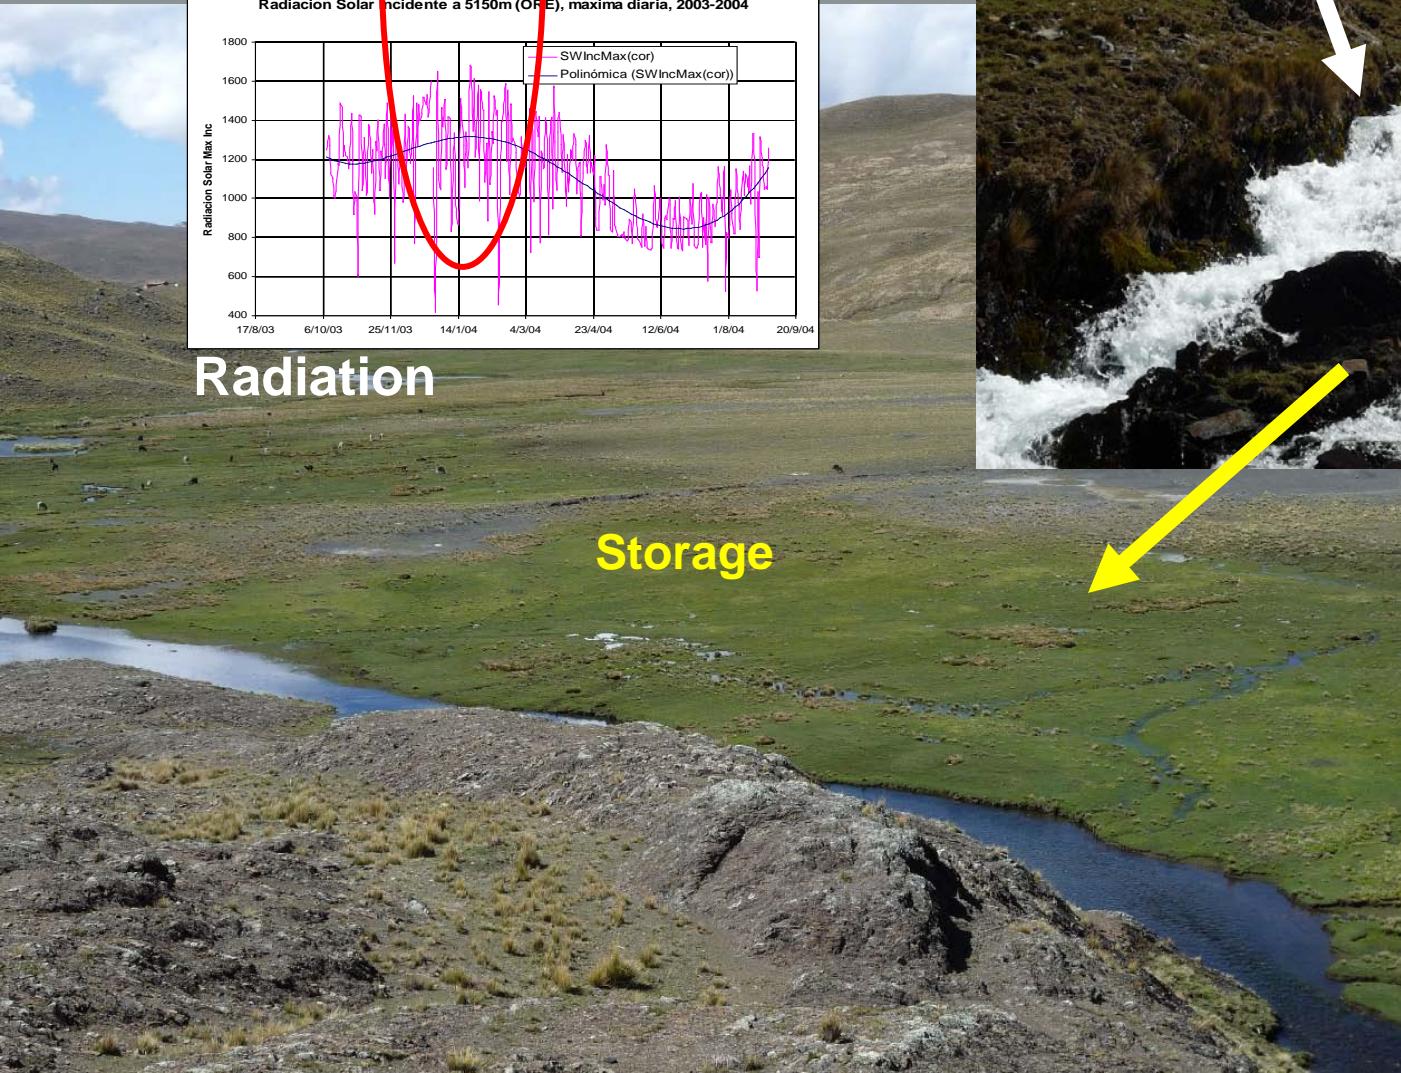

Radiation

Melting

Rainfall

Storage

During the summer  
(Rainy season)

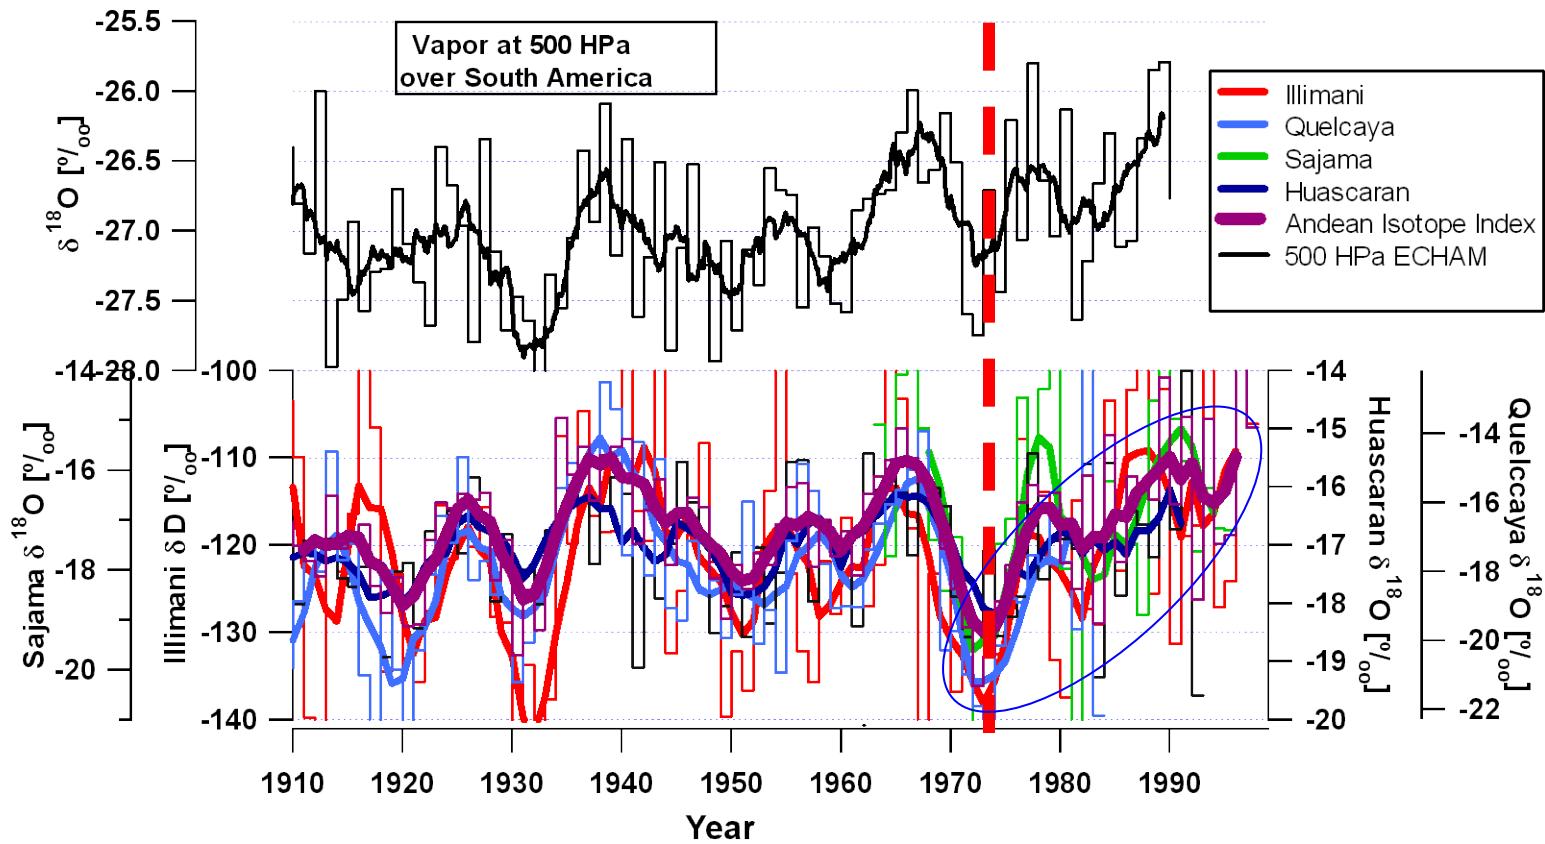

# In the Past

# In the Past: Andean Ice Cores for climate reconstruction

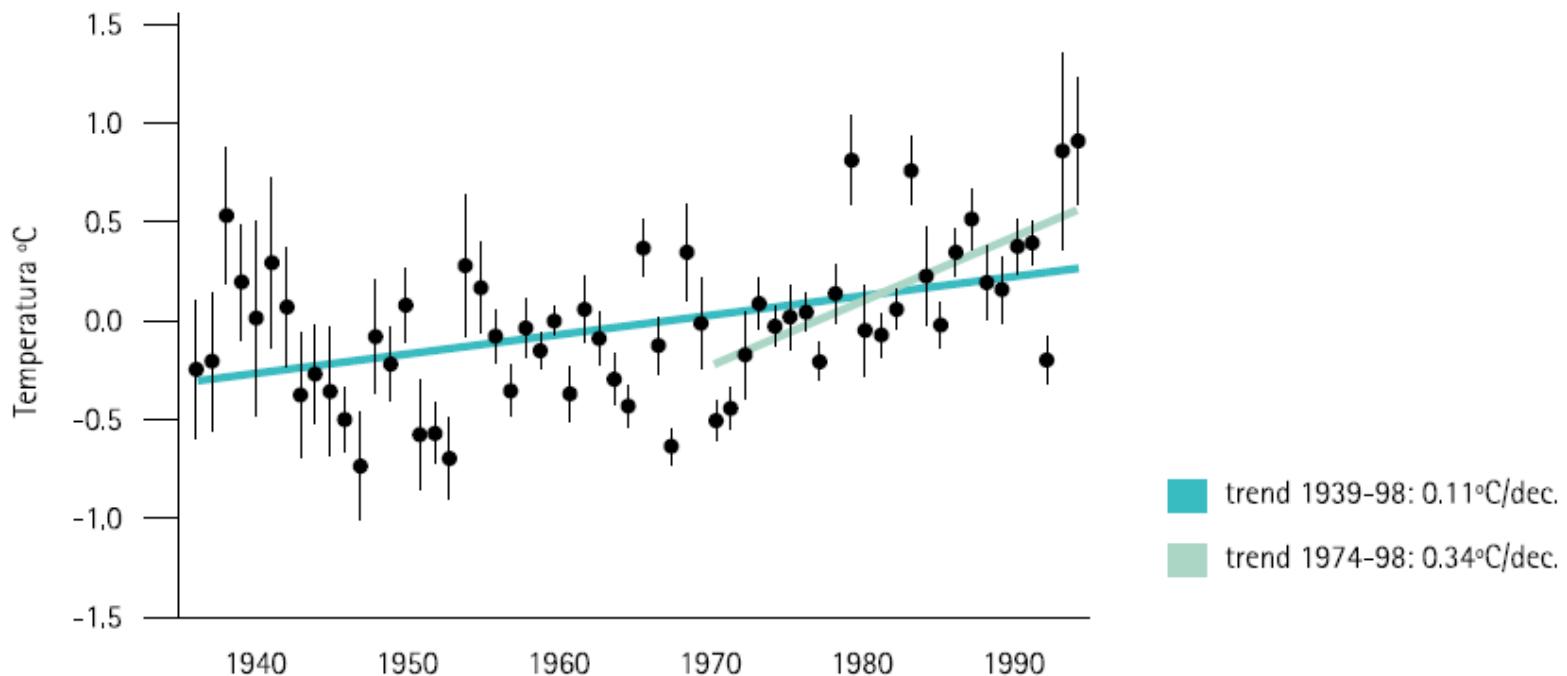

# IN THE LAST CENTURY

Four isotopic Andean drilling records compared with simulated ECHAM model outputs

(Hoffmann, Ramirez et. al. 2003, Geophysical Research Letters)

## - Temperature in the tropical Andes between 1939 and 1998 -

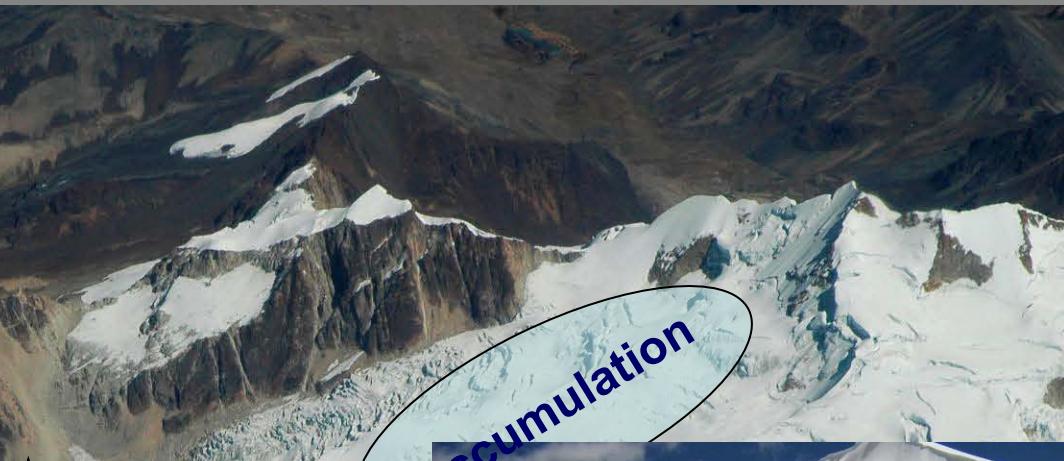

# In the Present

# Zongo glacier - Bolivia

# Hydrology

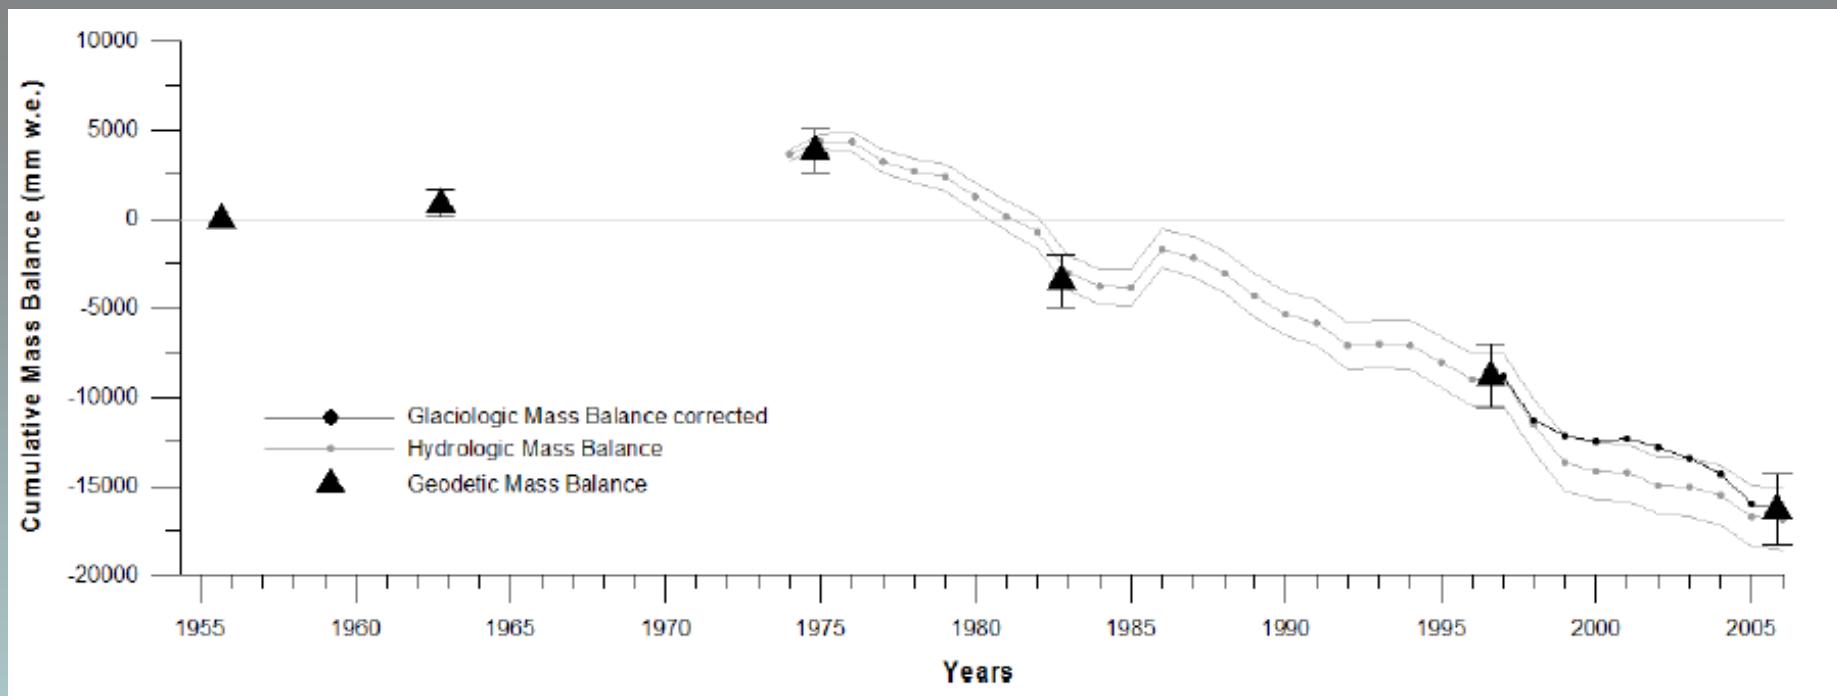

**Aerial photogrammetric missions since  
1956 to 2009**

**Photogrammetric mission in 2009**

**Bolivian Air Force & IHH-UMSA**

## Zongo cumulative mass balance reconstruction since 1956

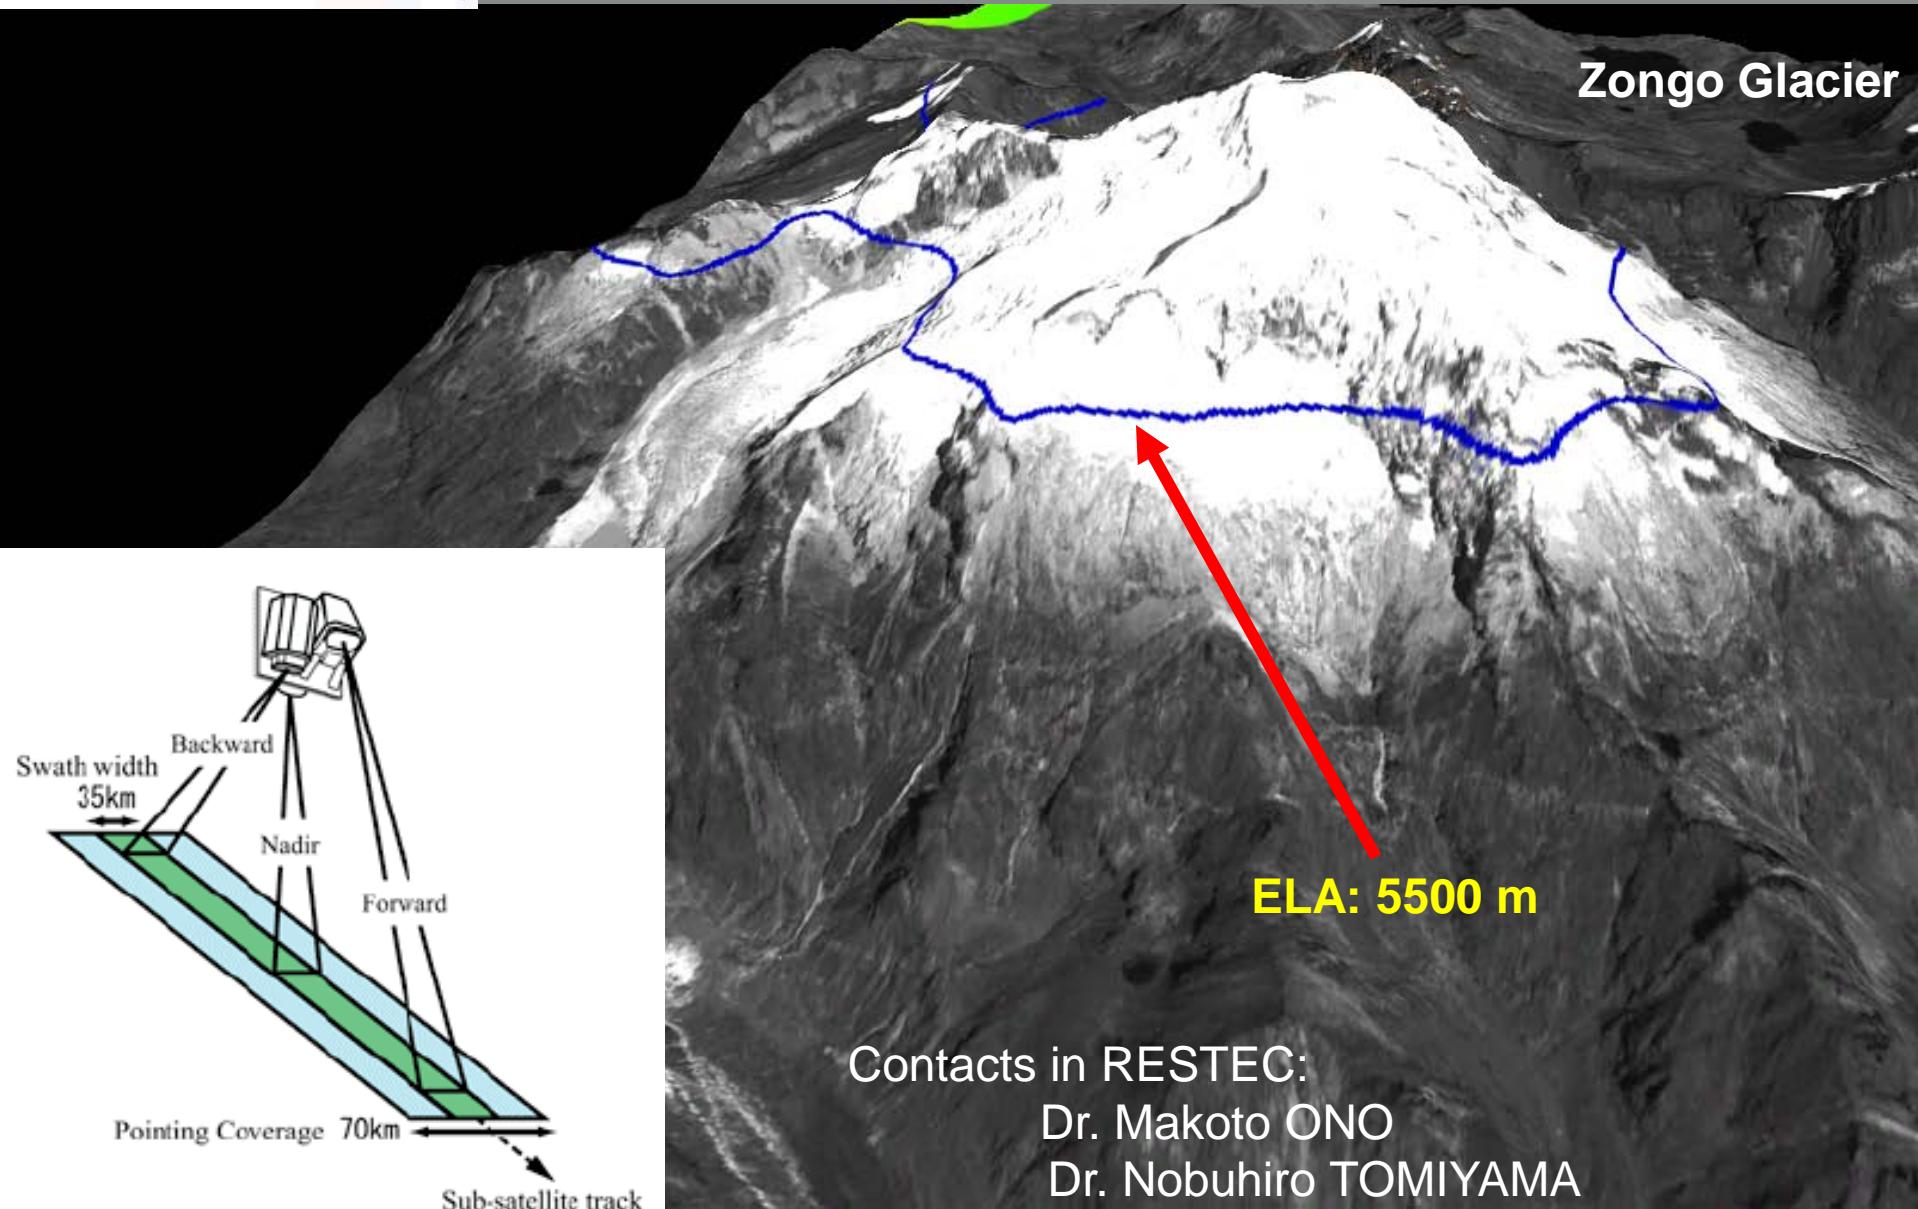

Recent studies shows the advantage of digital photogrammetric techniques in order to reconstruct glaciological mass balance.

The glaciological mass balances were calculated using yearly field measurements and adjusted according to photogrammetric data.

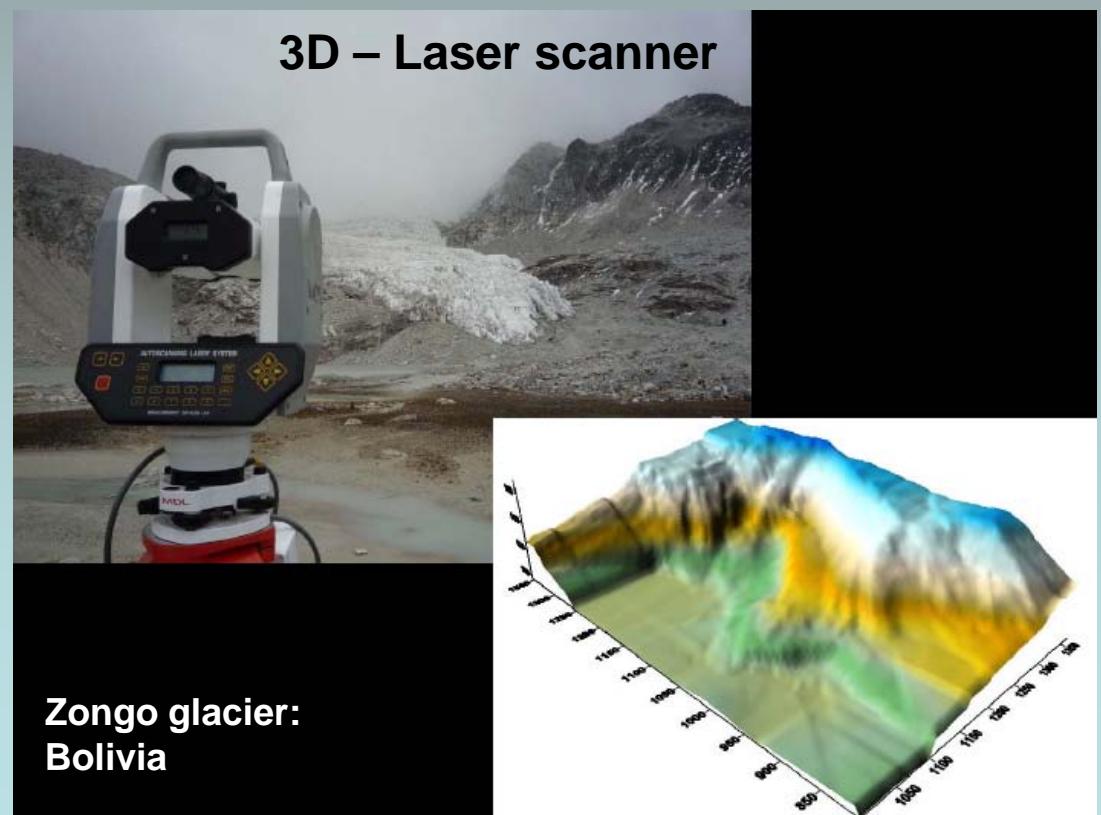

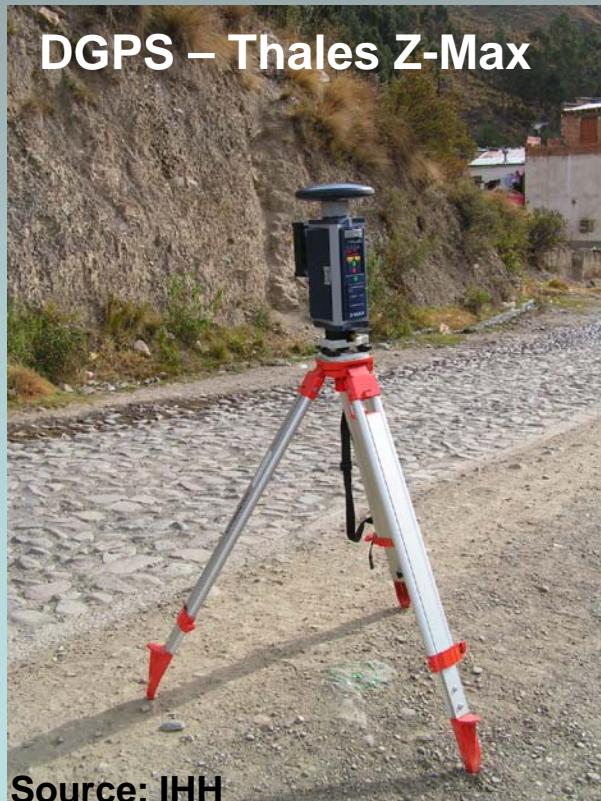

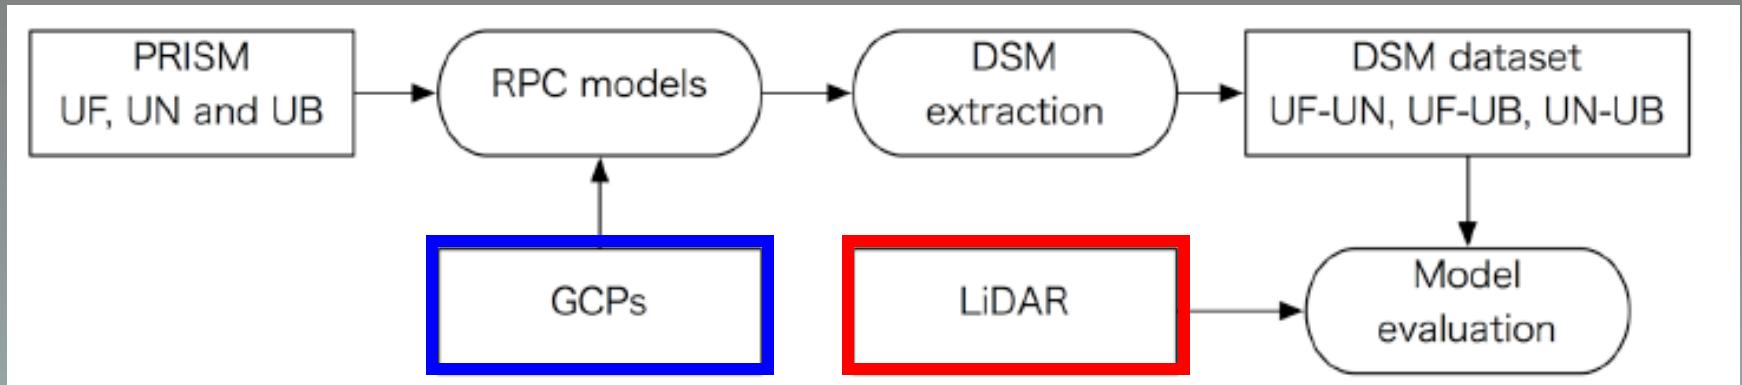

# Advanced Land Observation Satellite (ALOS)

## JAXA - RESTEC

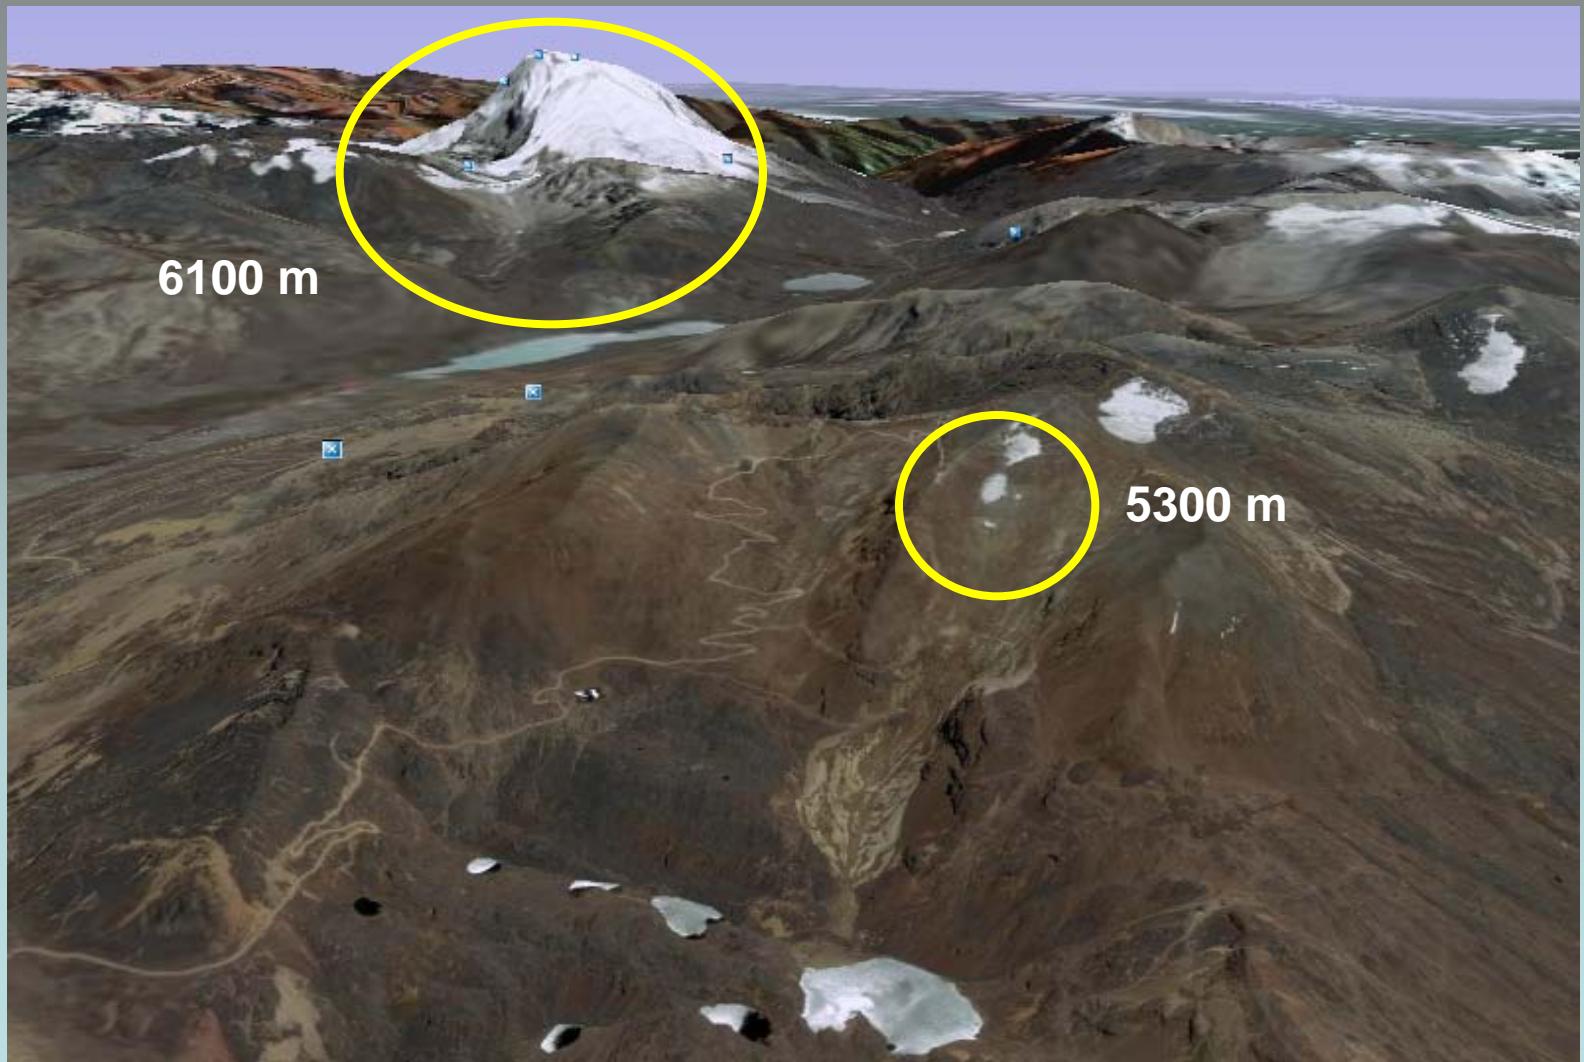

# COMBINING NEW TECHNOLOGIES: ALOS – DGPS - LIDAR

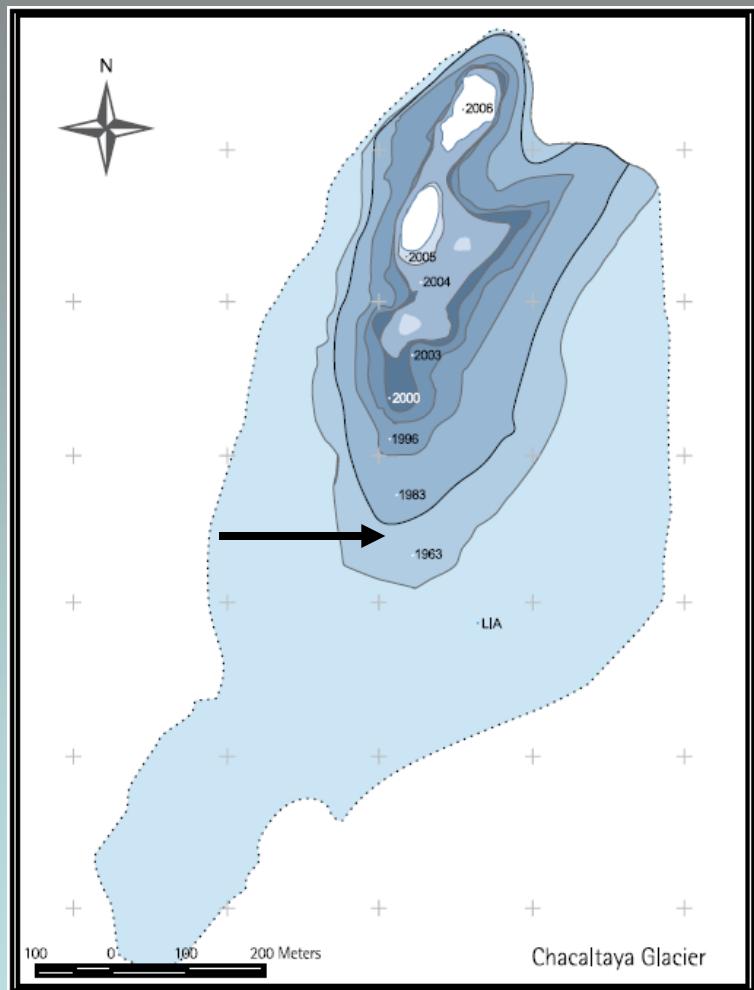

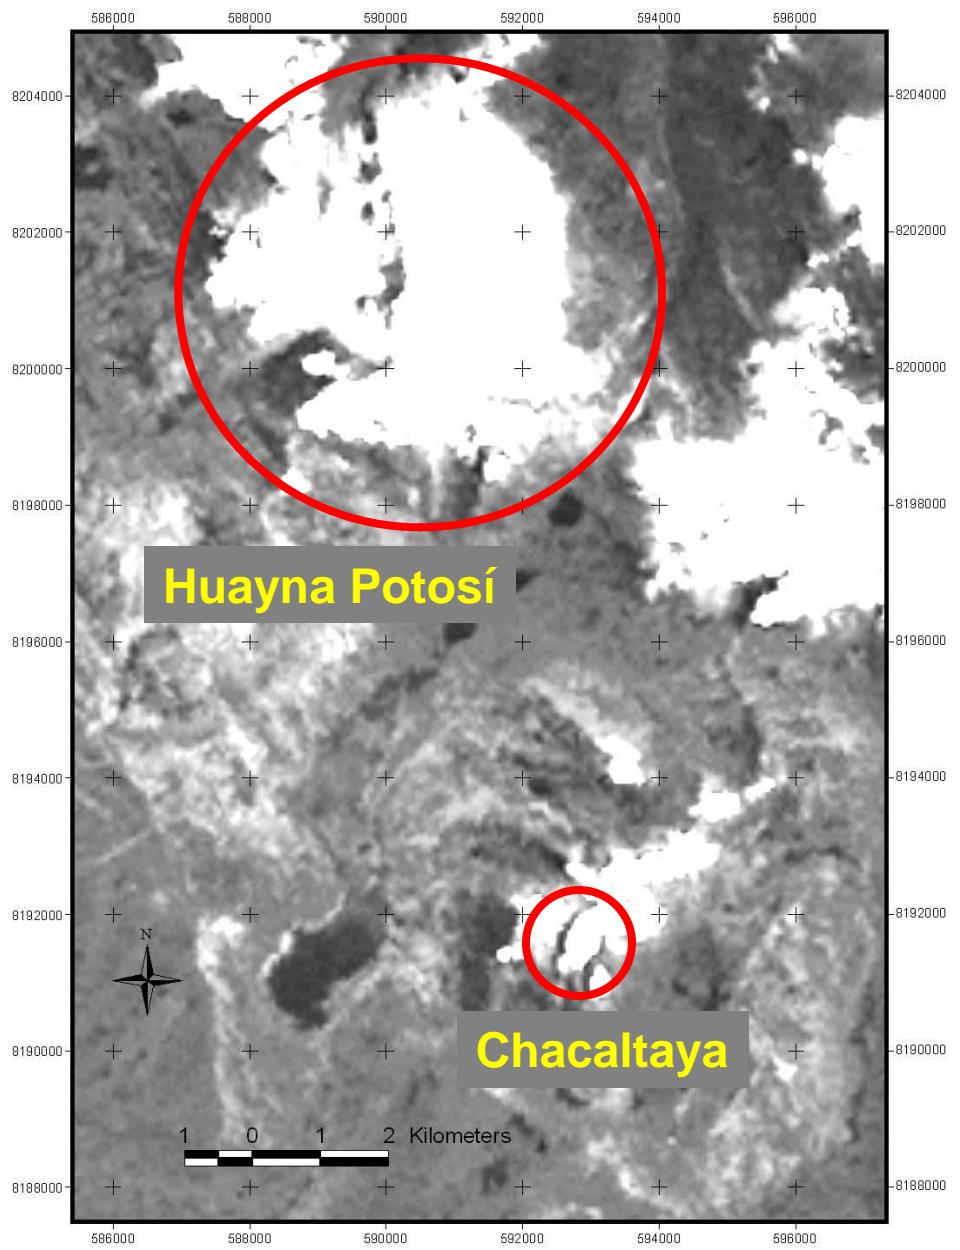

# CASES OF STUDY IN BOLIVIA:

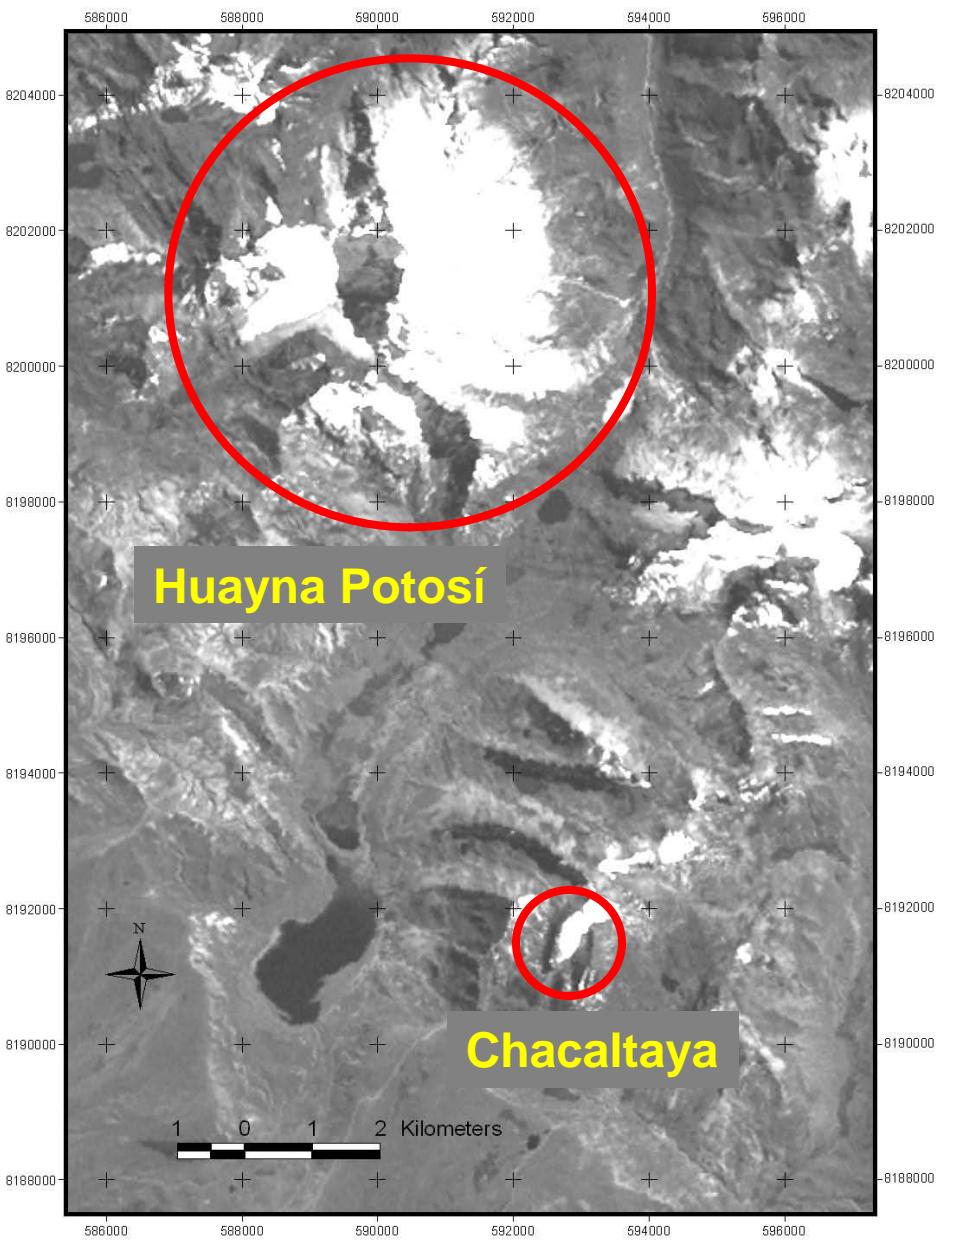

## ZONGO GLACIER (HUAYNA POTOSI) & CHACALTAYA

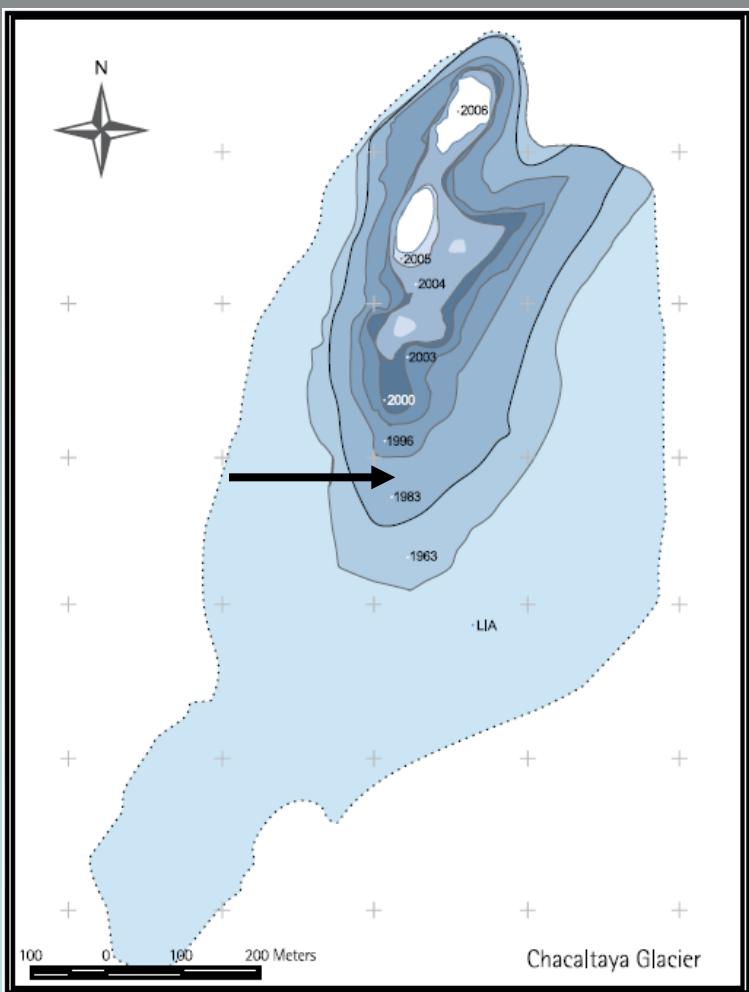

*Beginning of the Glacier Monitoring Program in Bolivia: 1991*

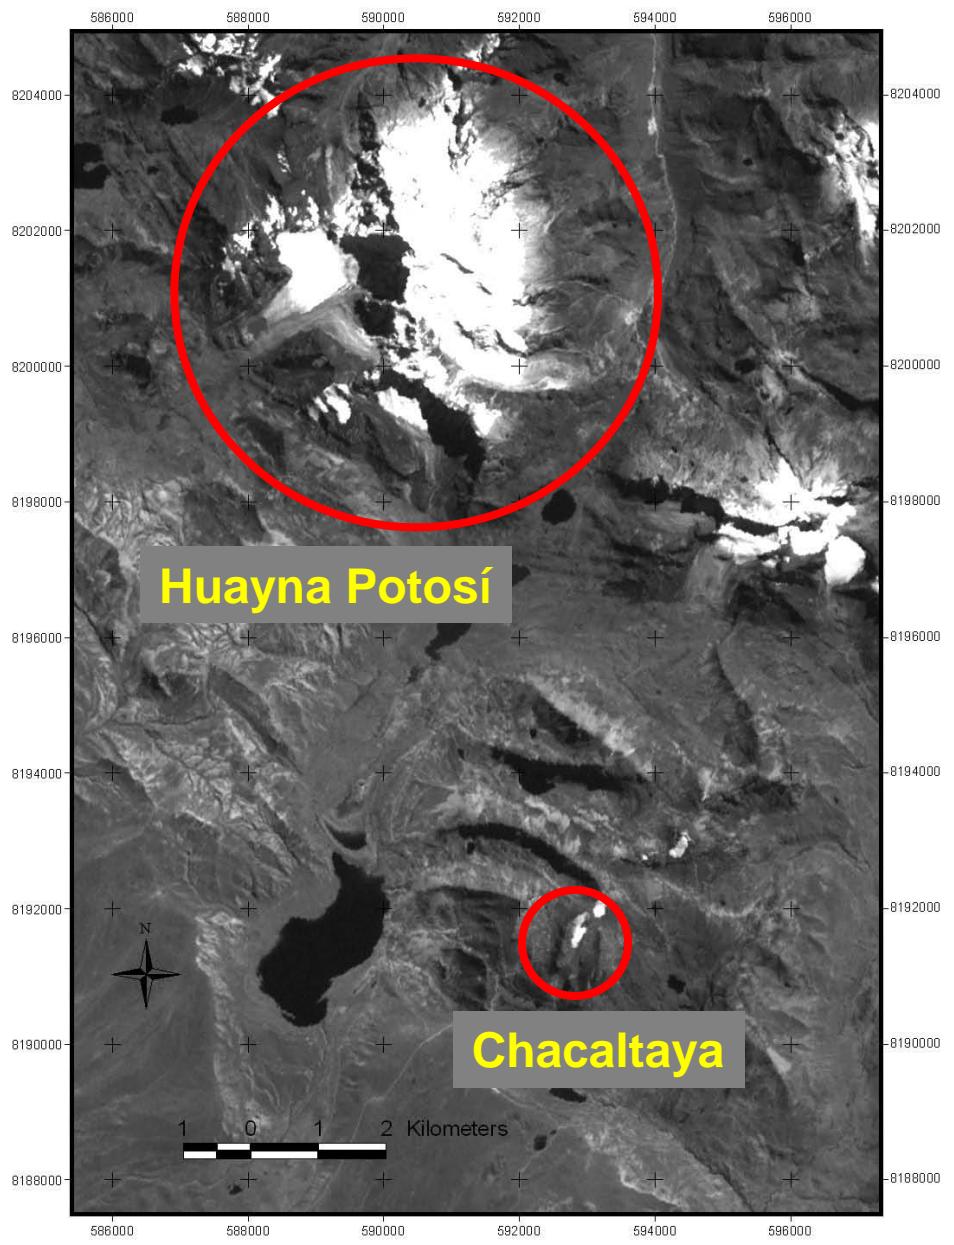

1975

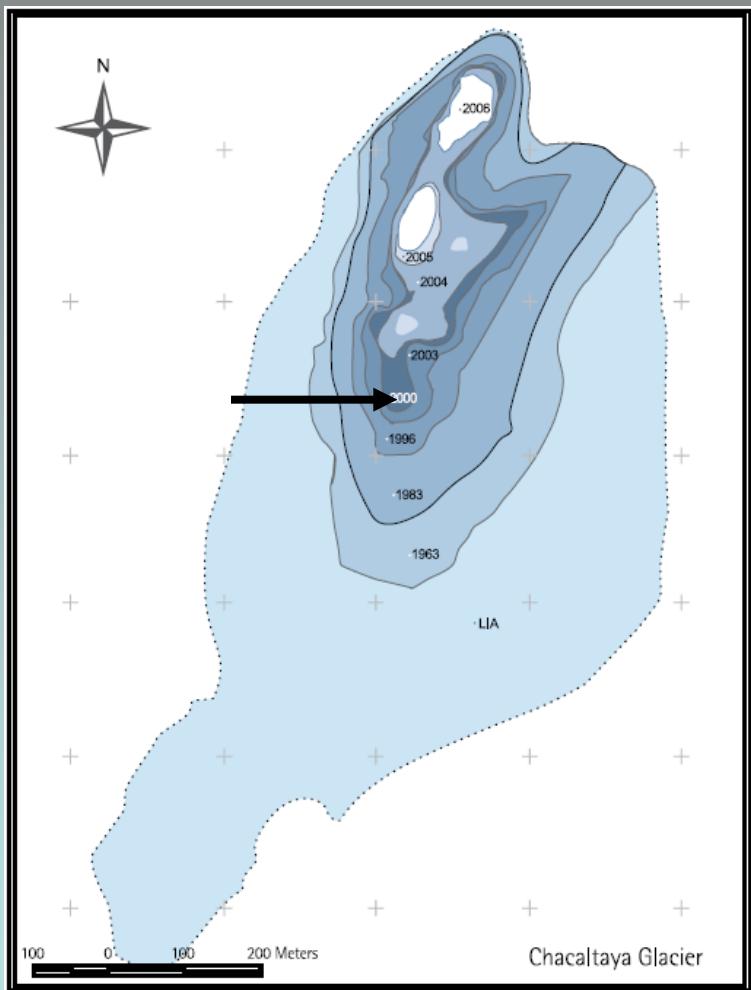

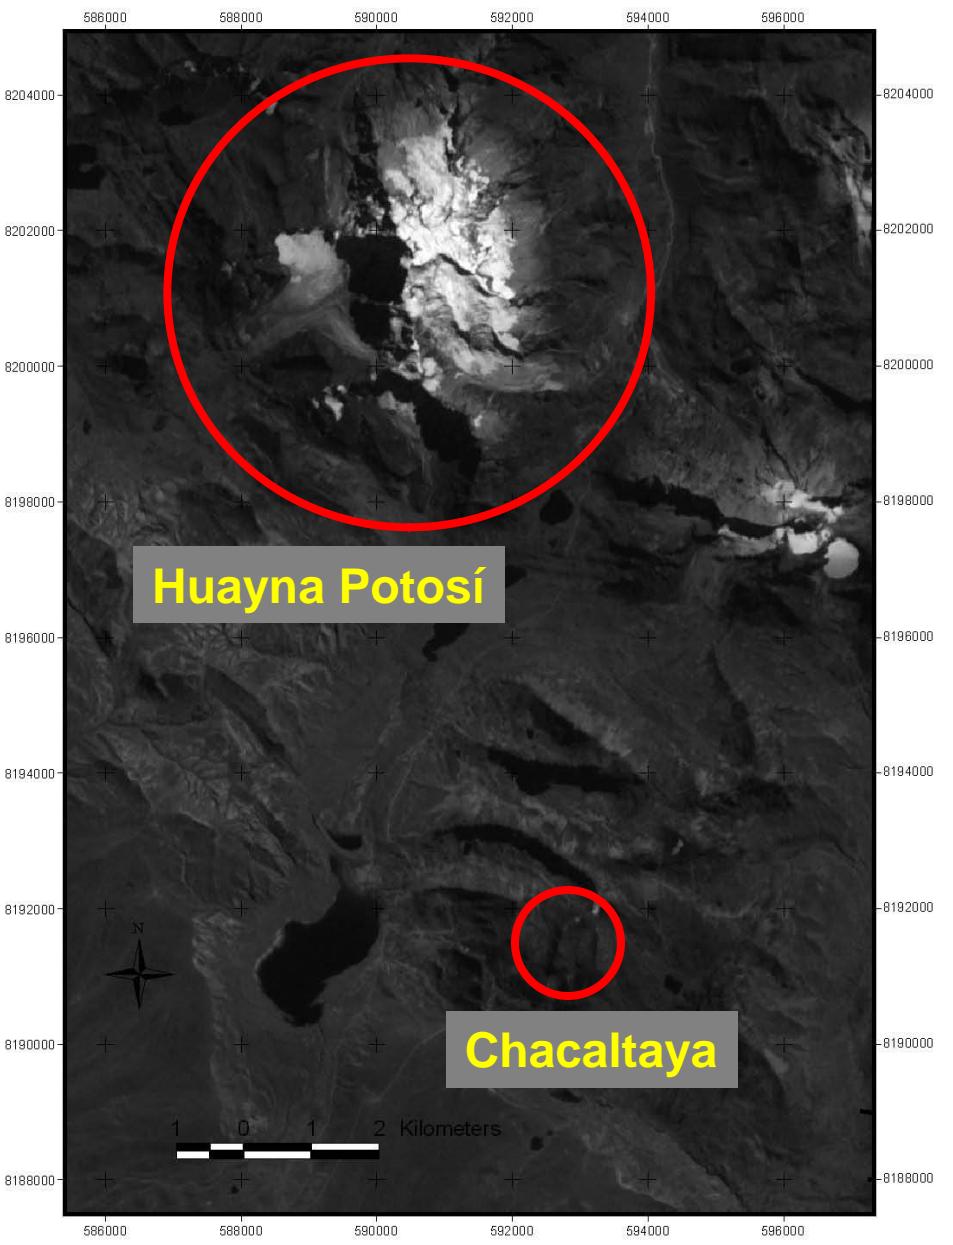

1987

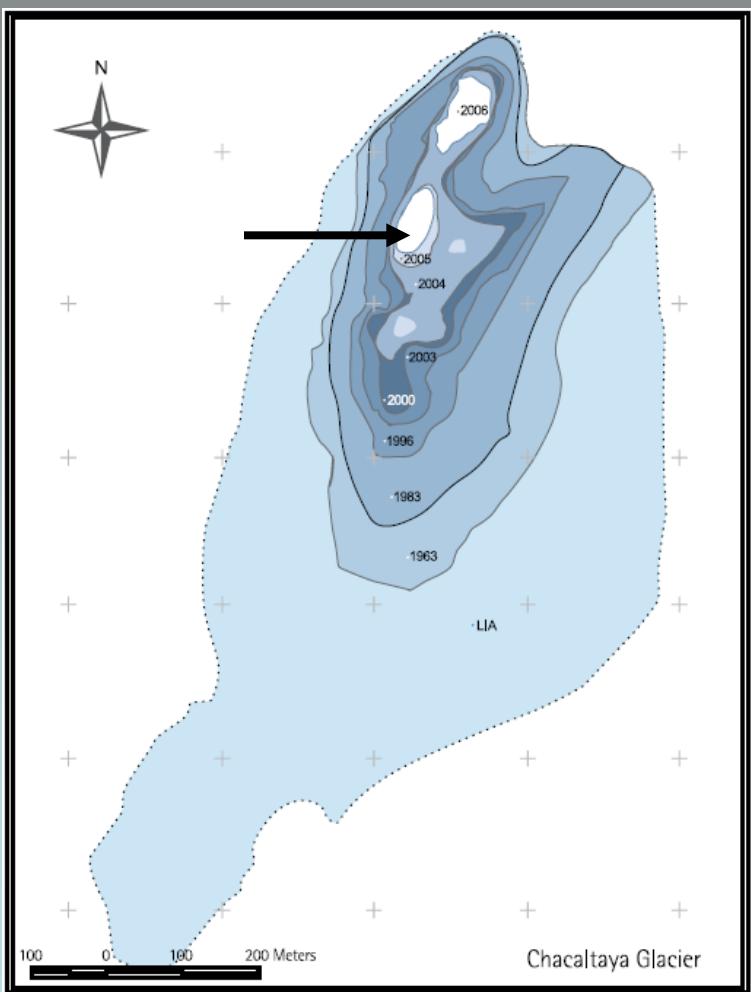

2000

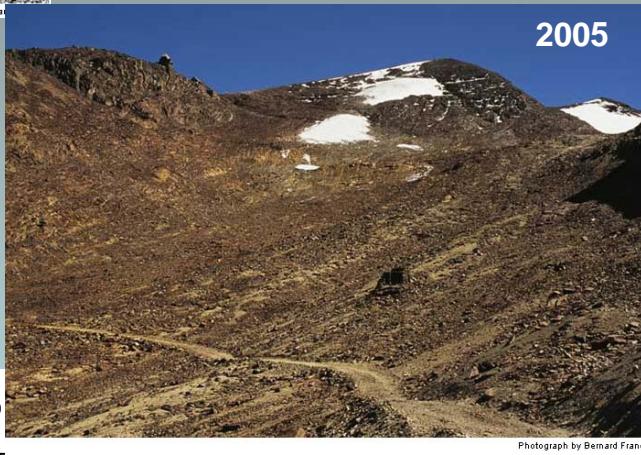

2009

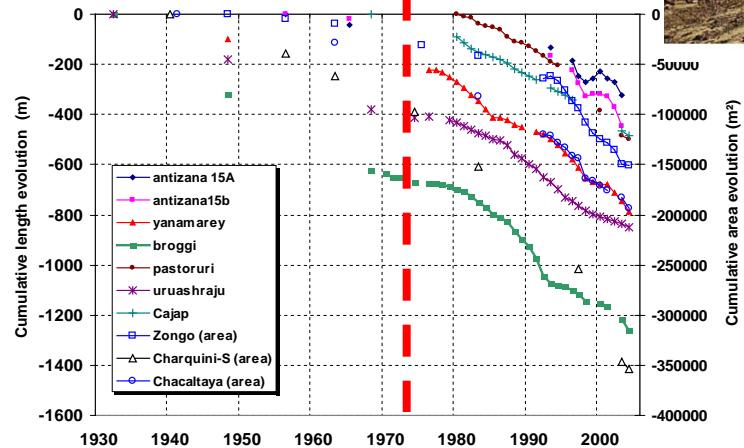

## Chacaltaya Glacier

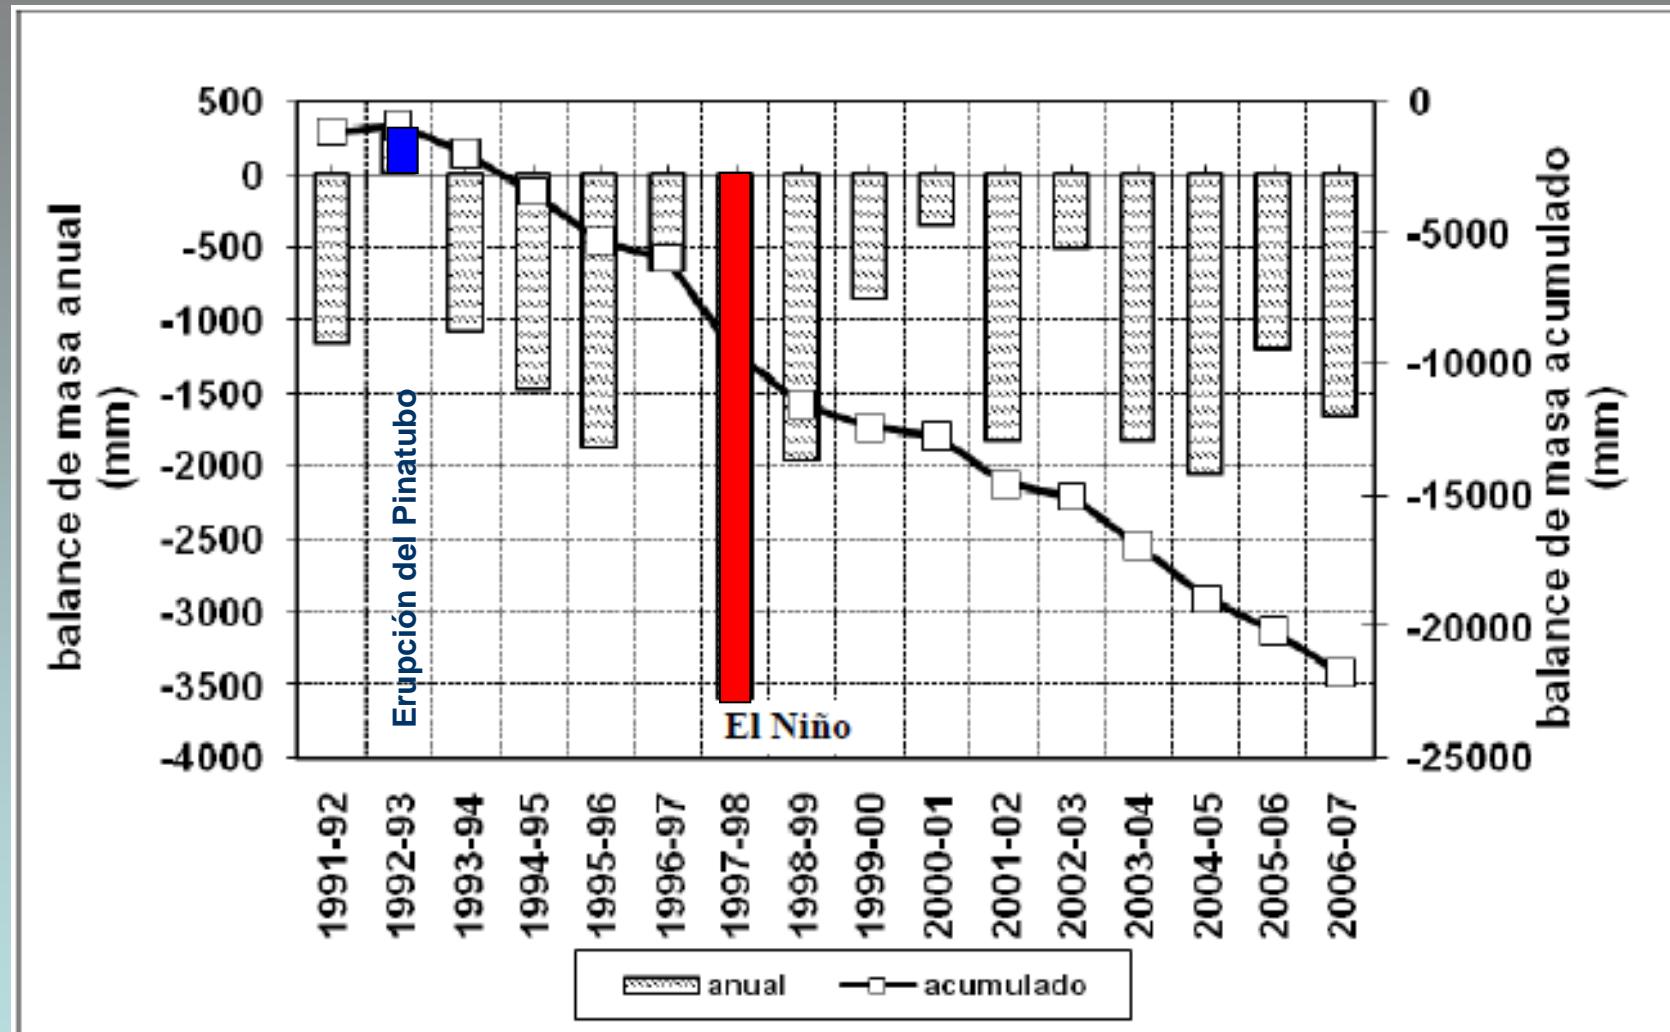

Geographical position:  $16^{\circ}21'S-68^{\circ}07'W$   
 Altitude range: **4700-5396 m**  
 Catchment area:  $0.52 \text{ km}^2$   
 Glacier area in 2007:  $0.003 \text{ km}^2$   
 General exposure: South

# Water resources in La Paz

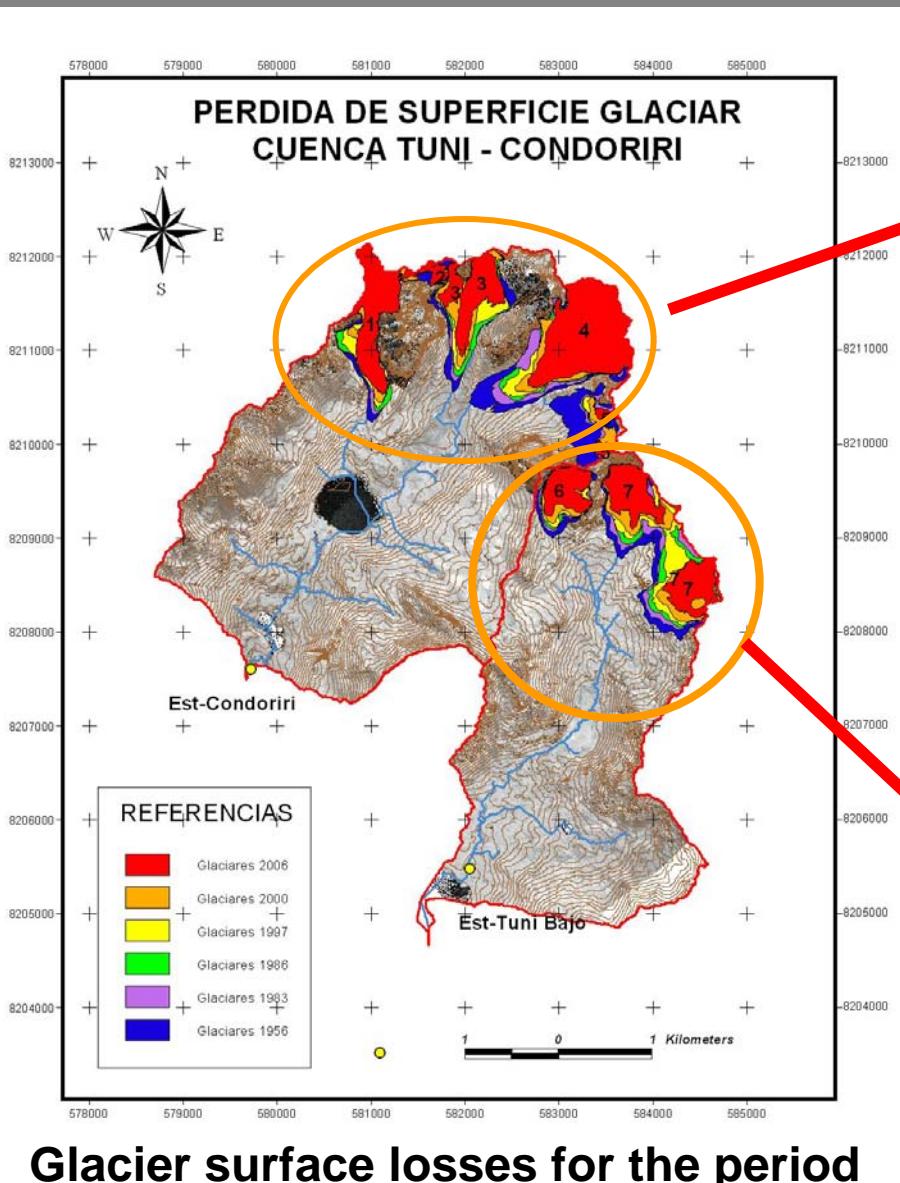

The city of La Paz, administrative capital of Bolivia, is located at 3600 m a.s.l. with a population of one million inhabitants.

An increasing migratory flow from the countryside has formed the city of “El Alto” (3800 m a.s.l.), also about one million inhabitants, that borders La Paz.

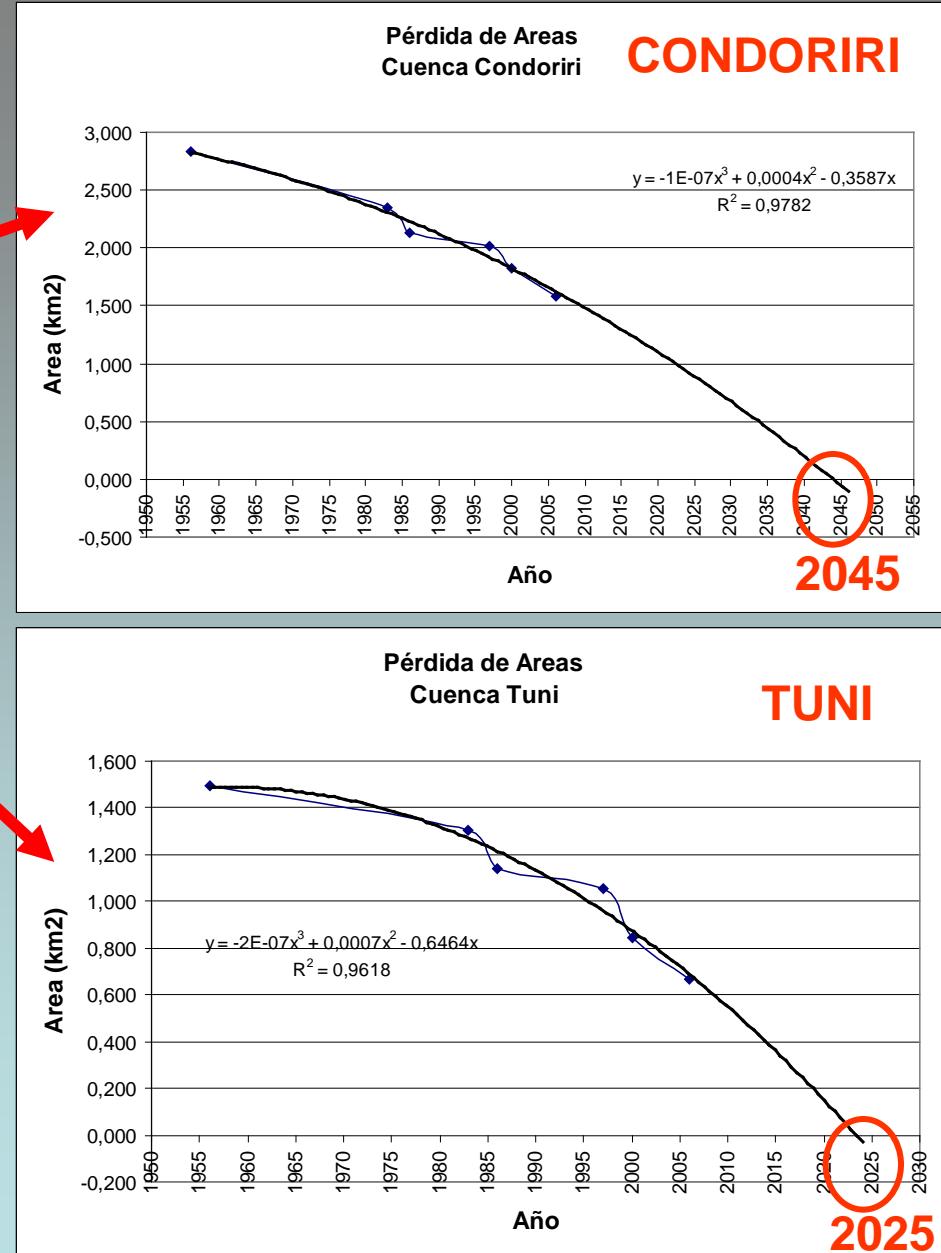

(Fuente: E. Ramirez)

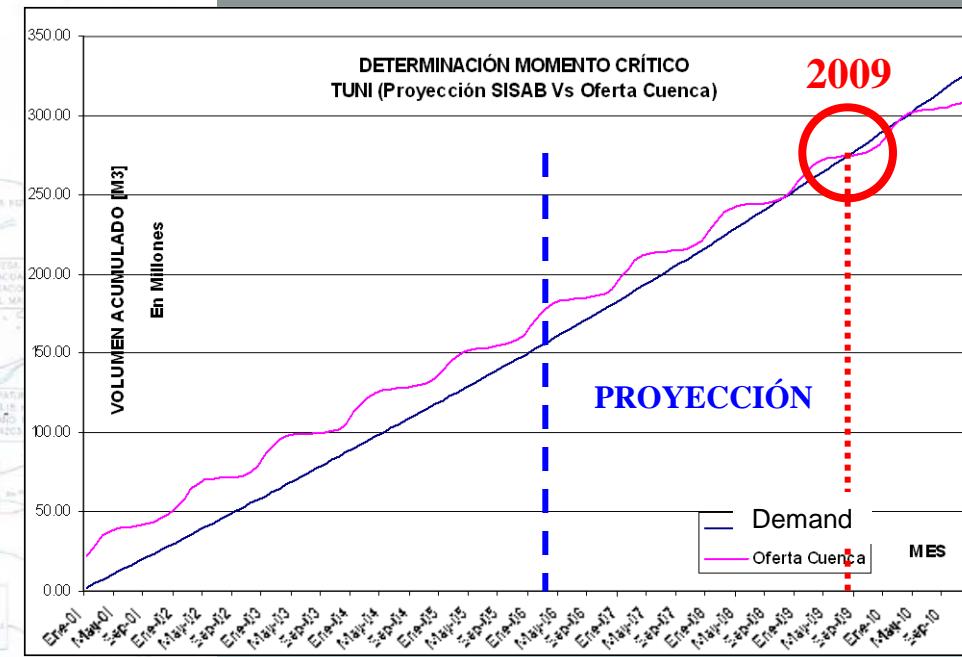

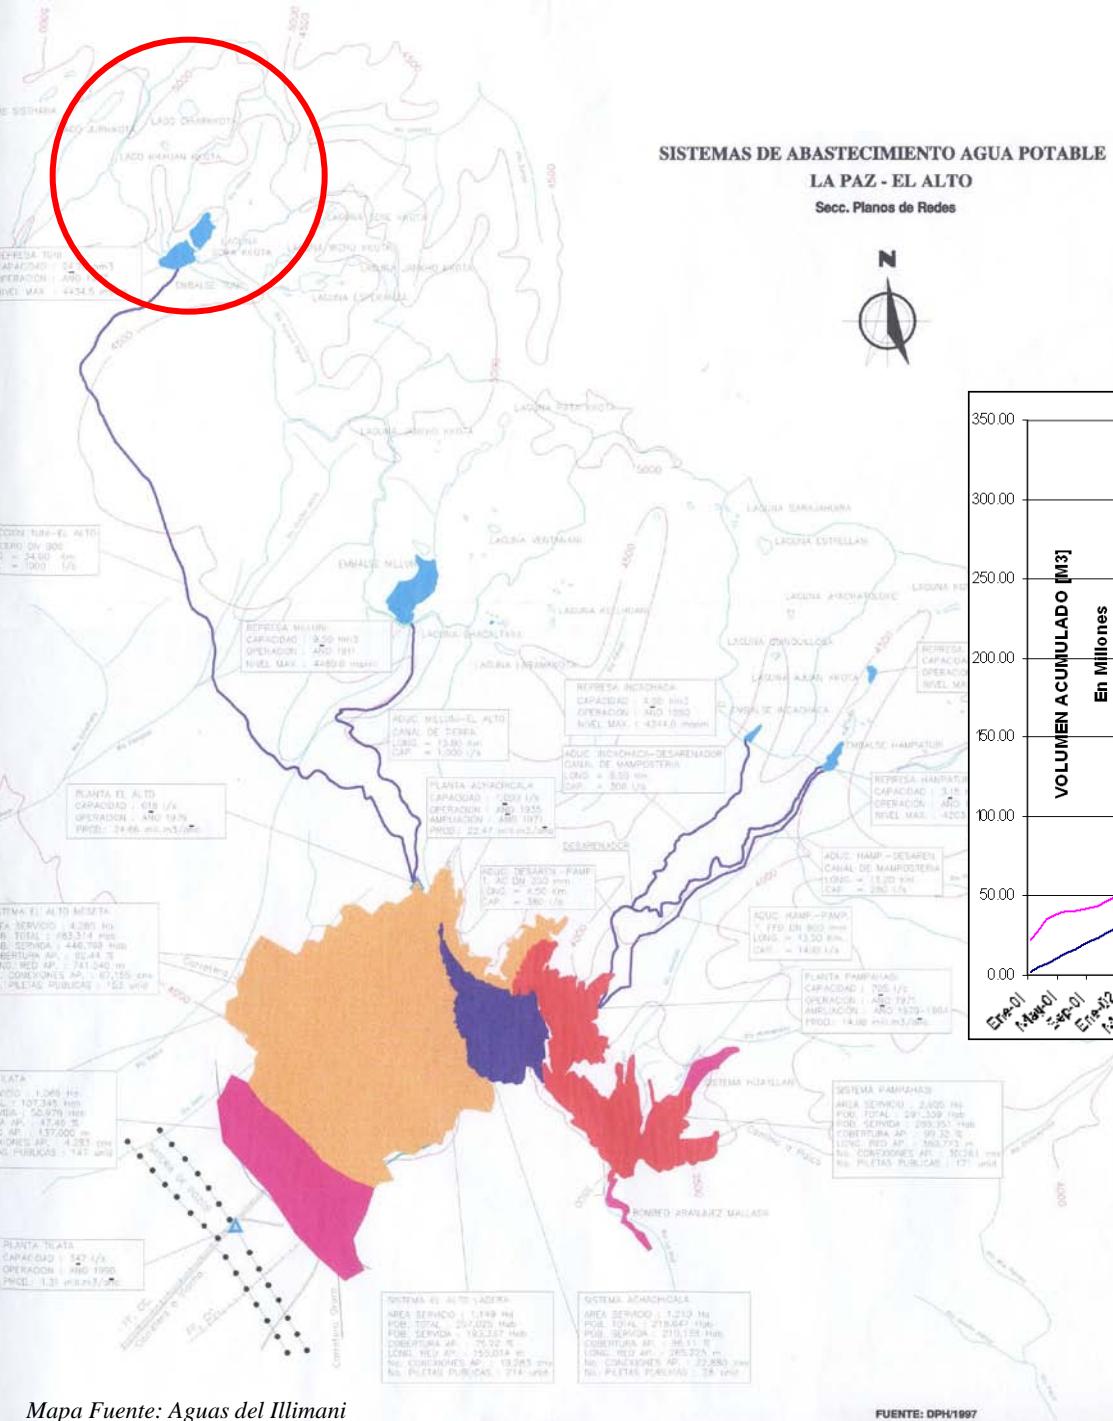

**Glacier surface losses for the period  
1956 – 2006**

**Condoriri: 44%, Tuni: 55%**

Source: IHH-UMSA, IRD

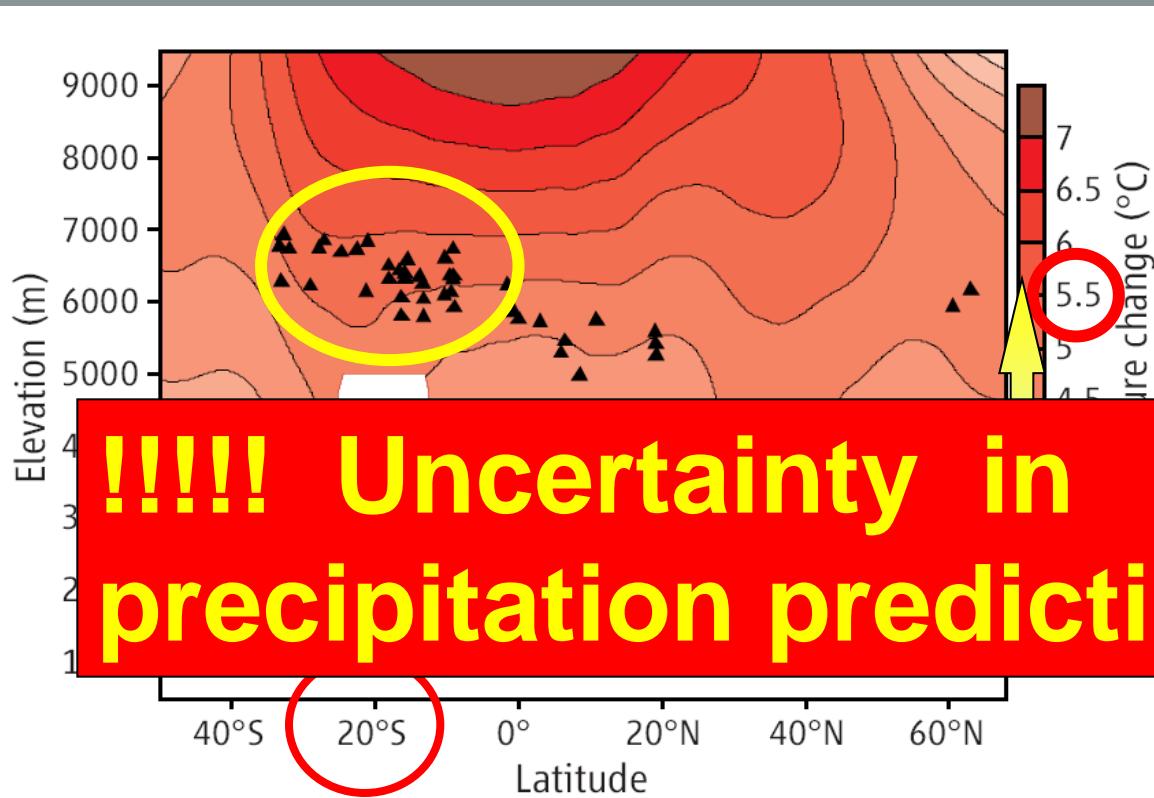

The analysis of the water demands and supplies for “El Alto” shows a break in 2009, where the demand will surpass the water supply.

(Ramirez & Olmos, 2006)

# ¿What about the future?

# Future climate in a world with double the preindustrial carbon dioxide (CO<sub>2</sub>) concentrations, according to general circulation models

The process of adaptation to the impacts of the climatic change will depend besides the water resources management

**Water availability**

**Uses of Water**

- Precipitation
- Melting (Glacier)

(Vulnerable to climatic change)

- Efficient use of water

(Vulnerable to the inefficient use of the water)

**At the present the city of “El Alto” loses in the water supply system even of 50%.**
